2 Compilation process

2.1 Frontend

The frontend is the main interface of the compiler: `ecmac`

It accepts any number of arguments and options.

Each positionnal arguments are considered as input files.

For each input file, the frontend test if it's an object file (or an up-to-date existing object file for this input file).

Use flag `-P` or `-parse-only` to stop compiler at parse-time.
